

Zone (Python project, pet project)

This project is about making the utility, which will contain all on the instruments and programs are in demand for any user - starting from the programmer, and ending with grandmother.

This is high level oriented project build on Python, GUI of which will be provided by tinter. My idea is to create not very minimalistic, but very informative and editable menu panel, where you can set the apps that you need, widgets (fast access to data), and my Assistant - Algo.

Utilities will contain a high range of tools, somehow integrated in the internal ecosystem with copilot Algo, who will provide more accessibility, and provide the new way to interact with the system. The screen on the page is the main menu - and approximately, the structure of it will be as in the image. Lets start from the functionality of the Algo, and conclude my ideas with some extra - optional features of the program.

Algo

Who is algo, what is algo? - Algo, is the new way to interact with the program, designed by me in order to provide the user easier and faster access to any functions inside of the program, using human language. Yes, no need to use "/" or "~" in your chat. It was engineered in order to make reminding but after a while, functionality and bot's possibilities gained new skills, even doing math's calculations. What bot will be able to do in the program?

- 1) Calculations - pretty simple, but very useful in need.**
- 2) File searching for the directory, and opening through the name or nickname you give to the file using bot.**

- Algo, open my encryption code
- Algo, where is my "SQL test" code?
- Algo, delete my "Test" file.

BETA* Using matrix analysis to find needed file in the system (May require full access to the pc data)

3)Reminder

Just type anything you need to be reminded about, and bot will do it by itself. At the moment bot already has an algorithm of RAC (remind asking recognition) and it will be improved in the future.

3)Weather checker

You will be able to set the sources you trust, to get more relevant information about the weather.

4)Any file operations

- Algo, create the note with the title: "Golden egg"
- Algo, copy the text from my text file
- Algo, check the text for mistakes*

5)Timer

In extraordinary situations can really help

What about tools inside of the program?

This program will contain App market, which will automatically search for the utilities made by 3rd party developers, and offer to install in directly to the app. How that is possible? You will see. The basic tools that will be available on the pc will include the apps such as:

- 1) Calendar**
- 2) Code obfuscating - easily secure your code from copying.**
- 3) Intelligent searching - easily find the files you need.**
- 4) Pomodoro technique timer**
- 5) Weather**
- 6) Font maker**

And what about online apps? Where will be available through the apps store, where an algorithm will be searching for interesting tools using GitHub api.
